An analytical overview of the regulatory relationship between the cells and tissues of bone marrow under the influence of external etiological factors in primary inflammatory response in normal haemopoiesis. This may be a starting point for understanding the regulatory changes and anomalies, not only in various pathologies of haemopoiesis, but also in tumor genesis that must be considered when treating patients, in the development of new drugs and forms, and implementing cell technologies in medical practice. (Cytokines and Inflammation. 2013. Vol. 12. № 3. P. 5–12.)

Key words: regulation, haemopoiesis, bone marrow, cells, factors, primary inflammatory response.
